WHITE TUQUE

March 28, 2023

Dear CurrentWare client,

CurrentWare has recently engaged with White Tuque, a cybersecurity firm based in Ontario, Canada and Illinois, USA, to conduct a review of its security practices. As an organization that produces software used by its clients for security services, CurrentWare understands the importance of ensuring that it has the right controls in place to protect itself and its clients against cyber threats.

CurrentWare has put in place an information security policy and system of controls aligned to the ISO 27001/27002 standard, with additional best practices from industry standard frameworks such as NIST 800-171, NIST Cybersecurity Framework (CSF) and the CyberSecure Canada Baseline Controls. CurrentWare actively reviews the security risk of third-parties they use for critical services and implements strong security features available from the services they use. In addition to taking a layered approach with proactive security measures, CurrentWare has an up-to-date incident response plan.

Further information on the system of controls can be provided by your CurrentWare representative upon request.

Sincerely,

Laura Payne
CNO & VP Security Consulting
